

Communications Recording for TETRA Advanced Public Safety Solutions

What ASC offers:

- Flexible recording solution for emergency communications
- Seamless integration with dispatch stations
- Distributed architecture with a scaleable channel array
- Enhanced screen recording, speech processing and workforce optimization

Solutions for TETRA...

- Integrate with all TETRA network vendors
- Offer fast and efficient playback of recordings
- Handle traditional telephony, VoIP and trunked radio communications on a single recording system

Communications Recording Solutions for TETRA

Recording of mission-critical communications for any public safety scenario

ASC's communications recording suite provides secure recording of all voice and data communications, including VoIP, trunked radio, and analog or digital telephony in command-and-control applications. Its products enable bulk recording of radios and talk groups in any zone. The flexible architecture allows either complete or selective storage of the data depending on the organization's requirements.

The ASC recording suite includes MARATHON *EVOlite*, MARATHON EVOLUTION, MARATHON EVOLUTION XXL and *EVOip*. All systems ensure power, reliability, security and open-source flexibility for any need.

Distributed architecture

With a scaleable channel array, the suite's systems capture and record all communications from four up to 480 channels simultaneously and may be configured to record, live monitor and archive communications from multiple locations at one site.

ASC's solutions connect multiple recording platforms, departments or locations, automatically transferring the data via a central INTERACTION server.

Maximum data security

ASC's recorders offer online storage of up to 280,000 channel hours. Mirrored and hot-swap hard disks provide optimal data security, and the recorder may also be equipped with IOMEGA REV or DVD-RAM drives and NAS for long-term archiving. Calls may be saved as WAV files for e-mail transmission.

Subject to change without notice. Please note that the maximum channel capacity is only valid under standard conditions. Depending on the usage, the complexity of a specific configuration, and the number and types of software applications installed, certain restrictions may apply. Please contact ASC for further information.

Quick access to critical information

The immediate replay of emergency calls is crucial to a successful response. Tagging of audio data with additional index information allows fast and efficient searching for recorded calls.

Users may choose either a browser-based application without any additional software required or Java-based client/server technology for replay via a local network.

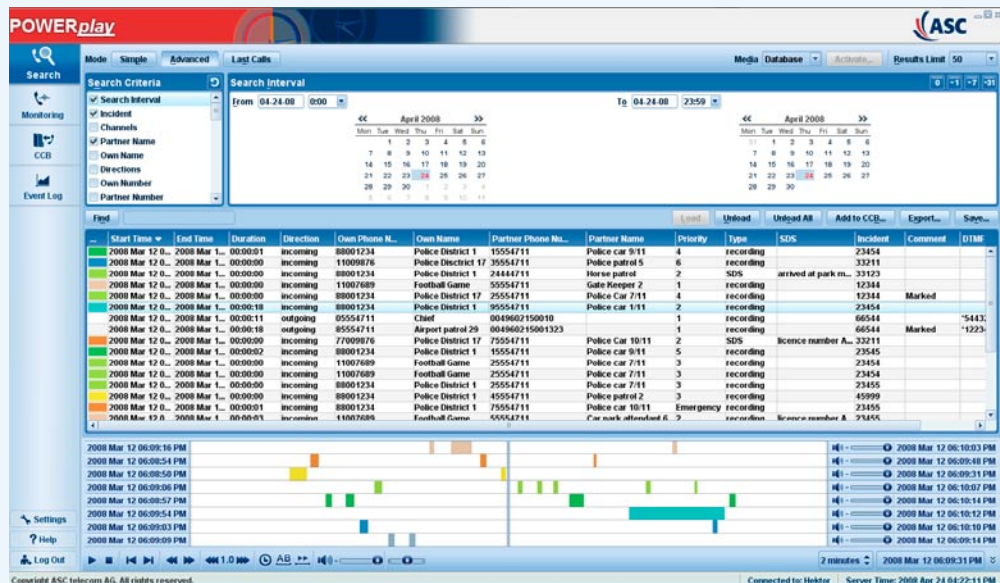

Select *INSTANTplay* or *INSTANT WEBplay* primarily for immediate retrieval of the most recent call.

POWERplay or *WEBplay* excel with flexible search criteria and other advanced functions.

Seamless integration

ASC's recording suite may be easily integrated into control rooms and dispatch stations.

- The ASC hybrid recording platform handles traditional telephony, VoIP recording and trunked radio communications on a single, scaleable recording system.
- CTI solutions capture additional call details and enhance fast and efficient searching for archived calls.
- The Application Programmer Interface (API) shares and integrates data among ASC's systems and command-and-control rooms.
